JBL

Bio- Algae blocker

- Reduces algae growth using "sunglasses effect".
- Blocks some of the light rays vital for algae to grow.
- Effectiveness indicated by light amber discolouration of water.
- Does not reduce pH or hardness levels.

JBL AlgoPond *Sorb*: Natural colour extracts found in peat produce a light amber discolouration of the water, acting like sunglasses to eliminate a specific spectral range of light. This blocks some of the light rays vital for algae to grow, slowing down growth. The pH level and carbonate hardness remain unchanged. Active iodine and vital ingredients also promote the health of the fish.

Use: every 4 weeks from early spring:

Shake the bottle before use. In a watering can, mix the required amount with pond water and carefully spread over the pond. Do not filter through active carbon.
