Product information

Ideal nutrition for plants

The right CO₂ concentration in the water is of great importance for the aquarium plants. Carbon dioxide is the main nutrient for plants and promotes their growth. Plants use the CO₂ for the photosynthesis and thus supply the water with essential oxygen. They prevent algae growth, remove pollutants, provide hiding places and reduce pathogens.

Economical and direct

This practical JBL CO₂ direct diffuser saves a diffuser in the aquarium, a bubble counter and a check valve. It even saves 20 % CO₂ thanks to its ingenious functioning.

Easy to install

The ProFlora Direct Membrane ensures the finest atomization of the CO₂ in the diffuser and can be replaced with just a few single steps in the JBL ProFlora direct.
