## Product information

### Ideal nutrition for plants

The right CO<sub>2</sub> concentration in the water is of great importance for the aquarium plants. Carbon dioxide is the main nutrient for plants and promotes their growth. Plants use the CO<sub>2</sub> for the photosynthesis and thus supply the water with essential oxygen. They prevent algae growth, remove pollutants, provide hiding places and reduce pathogens.

### Economical and direct

This practical CO<sub>2</sub> direct diffuser saves a diffuser in the aquarium, a bubble counter and a check valve. It even saves 20 % CO<sub>2</sub> thanks to its ingenious functioning. All that is needed is an external filter with a suitable hose connection.

### Easy to install

In order to ensure that the CO<sub>2</sub> gas passes as far along the inside of the hose as possible, the direct diffuser needs to be integrated into the hose as close as possible to the external filter. A vertical mounting position will ensure the best readability of the bubble counter.
