## Product information

### Ideal nutrition for plants

The right CO2 concentration in the water is of great importance for the aquarium plants. Carbon dioxide is the main nutrient for plants and promotes their growth. Plants use the CO2 for the photosynthesis and thus supply the water with essential oxygen. They prevent algae growth, remove pollutants, provide hiding places and reduce pathogens.

### Even enrichment

The magnifying glass in the transparent section enables an easier bubble counting for an exact dosing of the CO2 amount.

### Easy to install

Fill the bubble counter with water. Attach it with a hose to the CO2 system and to the diffuser (CO2 system and diffuser not included). Fix the bubble counter outside the aquarium with 4 suction cups on the glass or with 2 screws on the furniture.

### Safe

The bubble counter has a hose screw connection and can easily be cleaned and filled thanks to the bayonet catch with O-ring.

The correct CO2 amount varies from aquarium to aquarium and depends on the volume, the water movement and the planting of the aquarium. You can check the CO2 content by means of a CO2 test.
