Product information

Ideal nutrition for plants

The right CO₂ concentration in the water is of great importance for the aquarium plants. Carbon dioxide is the main nutrient for plants and promotes their growth. Plants use the CO₂ for the photosynthesis and thus supply the water with essential oxygen. They prevent algae growth, remove pollutants, provide hiding places and reduce pathogens.

Even enrichment

The JBL diffuser supplies the aquarium water with the main plant nutrient CO₂ in even-sized bubbles.

Easy installation

The diffuser is suitable for all common CO₂ systems. Attach diffuser with suction holder in the aquarium and connect with pressure reducer over backflow stop.

Cleaning: In the course of operation algae coatings might form in the inside of the diffuser modules. The diffuser can be cleaned easy and effective with JBL PowerClean (a chlorine liquid). For that purpose put the diffuser in a glass with JBL PowerClean and leave overnight. The chlorinated liquid completely removes all organic coating without corroding the plastic material. Rinse thoroughly afterwards and remount in the aquarium.

The correct amount of CO₂ varies from aquarium to aquarium and depends on the volume, the water movement and the planting of the aquarium. You can check the CO₂ content by means of a CO₂ test.
